User stories definition

User stories definition

A **user story** is a brief description of the benefit that the particular functionality should provide, including whom the benefit is for, and why the customer wants the benefit.

User stories definition

As a [type of user],

I want to [do something],

so that I can [desired benefit].

As a professional photographer,

I want to easily upload pictures from my camera to my portfolio website,

so that I can quickly show my clients their pictures.

User stories definition

As a [type of user],

I want to [do something],

so that I can [desired benefit].

A set of guidelines for writing good user stories

Independent: should be independent of other stories. Stories shouldn't overlap in concept and should be implementable in any order.

Negotiable: isn't an explicit contract for features. The details for how a story's benefit will be delivered should be open to discussion.

Valuable: needs to be valuable to the customer.

Estimable: is one whose scope can be reasonably estimated.

Small: tend to be small in scope. Larger stories will have greater uncertainty, so you should break them down.

Testable: provides enough information to make it clear how to test that the story is “done” (called acceptance criteria).

Features' chunking

Features' chunking

The goal is to find ways to **reduce scope** and **build** only **the most valuable pieces** of each **feature**.

Features' chunking

As a **user**,

I want to **be able to easily share photos with my friends**,

so that they can **enjoy them**.

Let's **chunk it**

- by the various channels to share photos
- by limiting to one photo sharing
- by additional functionality (tag users, add a description)

Scoping with story points

Scoping with story points

Story points - a type of currency for estimating the relative size of different user stories

(1 point for a small user story, 3 points for a medium one, 9 points for a large one;

S, M, L t-shirt sizes equivalently; etc.)

A feature chunk is corresponding to a user story with an acceptably small scope (an estimated number of story points that is below your maximum threshold).

ROI for features prioritization

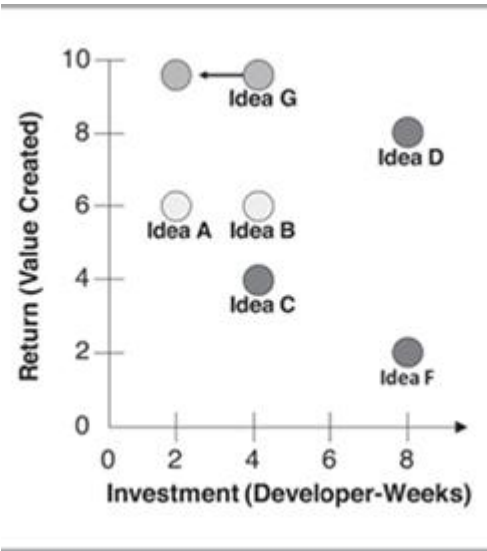

ROI for features prioritization

ROI = Return ÷ Investment

Return is usually some relative measure of the amount of customer value you expect a certain feature to create.

Investment is usually the time that your development resources spend working on it, which you generally measure in units such as developer-weeks (one developer working for one week).

ROI for features prioritization

Option A

Return (Value Created)	High	Medium	Low
	1	3	6
	2	5	8
Investment (Developer-Weeks)	Low	Medium	High
	4	7	9

Option B (Approximation)

Choosing your MVP candidate

Choosing your MVP candidate

Benefits types inspired by the Kano model

- **Must-have benefits:** their absence causes customer dissatisfaction.
- **Performance benefits:** those on which you choose to compete to beat the competition, provide enough for customers to see the difference in your product.
- **Delighter benefits:** unexpected benefits that exceed customer expectations, resulting in very high customer satisfaction. The absence of a delighter doesn't cause any dissatisfaction because customers aren't expecting it.

Choosing your MVP candidate

Create a simple grid that lists the **benefits** from your value proposition and the top feature ideas broken into **chunks for each benefit**.

Next steps

Next steps

1. Continue writing user stories for main features of your product/service
2. Continue with feature chunking
3. Scope your user stories with story points
4. Use ROI to prioritize the features
5. Choose your MVP candidate
